Get your company to show fiscal control of assets. Get Control, 2.0.4005, 12/9/2019, Download. Track your equipment with an asset manager. See the ins and outs of equipment use. Read about Revit 2017 specifications. Watch the introduction video.

Introduction This year's Revit 2017 release includes important changes in the way you add, edit and report on elements of your models. This new functionality, which we call ARX (Assets Report eXtension), is built on a foundation of the work the Asset Manager has been doing for years. The Asset Manager is the primary tool for managing assets in a design-built asset management solution, and it continues to provide the same level of functionality as its predecessors. The key new feature in this release is ARX. ARX works seamlessly in conjunction with Asset Manager software and defines the functionality that's traditionally been provided by third-party programs that are designed to track the usage of assets. ARX provides a database of metadata that's automatically and securely created at model time, and it can be used in reports to generate reports that your users can see and print. You can see and print reports to the built-in ARX report layout, or you can define your own report layout to present specific data to users. ARX is smart enough to understand the relationship between assets and elements such as component families, so reports automatically reflect the component families included in the asset or in a model element. For example, you can create a report of "Assets used in a family." In other words, the report generator that the software creates can understand whether you're asking about assets, family members or, if you want, both, and you can tailor reports to include just assets or family members or both. What ARX provides

The new functionality in Revit 2017 includes:

- Supports the ability to view and report on the usage of assets and families, including any families shared between materials, components and other model elements
- Allows viewing and printing of reports of usage, including family members
- Supports the ability to view and report on non-Revit-managed assets, such as tracked files and third-party systems such as CATIA V5
- Supports viewing and printing of reports of material usage
- Supports viewing and printing of reports of component usage
- Supports viewing and printing of reports
